

The edudip next webinar interface (API)

Automate your webinar management:
quick, easy & efficient.

What is an API?

An API is a programming interface with which software can be connected to other systems or programs.

Easy integration

The edudip next webinar API offers you the full flexibility to seamlessly integrate our webinar software in your website, CMS or LMS. This gives you complete control over your user and event data.

With the API you can

- **easily** integrate webinars into your website, CMS or LMS
- **quickly** register participants
- create and plan webinars **efficiently**
- manage moderators

Leading-edge technology

The API is based on the open REST industry standard and the HTTP protocol. It can be used with any common HTTP client and programming language with ease.

Highest security standards (GDPR)

All API requests and responses are encrypted using SSL SHA-256 and are therefore protected against access by third parties. API tokens are used for authentication, which can be reissued and withdrawn at any time. This offers you maximum flexibility and the highest security standards at the same time.

We are happy to help and assist you with the realisation of your projects with the webinar API from edudip next. If you have technical questions or are unsure whether your use case can be mapped by the API, we are your personal point of contact
